

WatStech secures Severn Trent Water framework sampling contract

Severn Trent Water has awarded a three year framework agreement to WatStech Limited to complete flow & load monitoring, Jar Testing and COD Fractionation Studies at a number of its waste water treatment plants.

Using techniques created through extensive collaboration with Severn Trent Water's Process Design Group and R&D Teams, WatStech Limited will supply comprehensive plant status information to allow modelling, treatment selection and process design for the AMP5 Waste Water Treatment Improvement programme.

WatStech Limited has previously operated a series of waste water treatment pilot plants for Severn Trent Water and has completed trials to evaluate the effectiveness of enhanced treatment using controlled chemical dosing. These are examples from a range of services that are offered to optimise existing plant or to evaluate alternative treatment solutions; including assessment of likely operational efficiency ahead of full scale capital investment.

Rosemary Barker, Senior Engineer, Severn Trent Water said "WatStech offer a cost effective and timely service for on site sampling surveys. They manage the whole process from gaining site approval, submitting samples for lab analysis, checking and querying results to issuing a final report."

WatStech Limited is ideally situated to support Severn Trent Water's contract, having Offices and Laboratories in Wolverhampton in the West Midlands. WatStech Limited provides specialist and bespoke laboratory and pilot plant services for major water and wastewater service companies in the UK.
